Welcome to the Fortis Games Prompt Process!

Thank you for taking the time to apply with Fortis. We use these prompts to build a conversation focused on your thought process and how it applies to the sort of problems you are likely to confront as a part of the company.

At Fortis, our vision is to craft "Games Where You Belong." We want our games to operate as durable places where people feel a sense of connection to one another. We believe the best way to do that – our mission – is to create worlds that matter. Games that challenge minds, build ties and inspire communities across decades.

Achieving that goal requires a different approach than you might find elsewhere. We have a set of values that are core to who we are, which guide us in this approach (see below).

We must be informed by the market but willing to disregard it. We tackle each problem from first principles and develop our solution by asking how best to satisfy the needs and wants of our community of players. This process is at the core of all of our decisions and every person is a part of that collective effort to make the best choice in complicated, ambiguous situations.

We do not believe a single interview (or even a series of them) is an adequate medium to understand how a person thinks about problems, particularly given that many people are uncomfortable in that setting. We hope we have designed these prompts to give you a broad opportunity to demonstrate your thought process and its practical application. We've found this to be a highly reliable indicator that you would be successful in the role and thrive in our culture. In the end, our goal is that you feel comfortable with the responsibilities of the role you're pursuing and confident in your alignment with Fortis' mission and values.

Fortis Prompt Instructions

Please carefully read each question provided and respond thoughtfully, ensuring you address the initial question and any follow-up questions. Your responses should focus on specific examples and experiences, highlighting relevant skills and achievements where possible.

As a general matter, good answers take the time to document not just the idea, but the considerations behind it and some examples of how that idea might be implemented. We suggest you return your prompt when you believe it is an accurate reflection of your ability to critically examine the problems and provide insightful, original and thoughtful responses.

Building Your Solution

- Carefully review the problem statement and requirements in the prompt.
- Your solution should demonstrate clean, efficient, and well-structured code that aligns with best practices.
- Clearly document your approach, including key design decisions, trade-offs, and any assumptions made.
- Consider edge cases, performance optimizations, and scalability where applicable

Code Submission Guidelines

1) Your submission must be in English.
2) There is no strict minimum or maximum length requirement, but ensure your solution is complete and well-documented.
3) Solutions should be original and showcase your technical skills, problem-solving approach, and attention to detail.
4) You may use AI-assisted tools to refine and enhance your code's clarity, but do not rely on them to generate core logic.
5) Remember that this exercise is a tool for assessing your knowledge against the role requirements.

Submitting Your Solution

- Package your submission in a GitHub repository, ZIP file, or as instructed by your recruiter.
- Ensure your files are well-organized, named appropriately, and include any necessary setup or run instructions.
- Submit your completed solution via the Greenhouse link provided in your initial email or as directed by your recruiter.

WHAT HAPPENS NEXT?

- Your submission will be reviewed by senior engineers and technical leaders to assess its correctness, efficiency, readability, and overall quality.
- If your solution meets the evaluation criteria, you'll move forward to a technical panel interview, where you'll discuss your implementation, design choices, and potential improvements.
- Your recruiter will update you on the status of your submission once feedback is received.

If you need additional time, please communicate your expected timeline with your recruiter. We encourage you to prioritize quality to ensure your submission reflects your best work.

Staff Client Engineer Prompts

Some third-party Unity SDKs (Analytics, Ads, Backend) have a common flaw: they are leaky and often crash or hang the main thread if the network or local state is unstable.

The Task: Build a Resilient SDK Proxy Tool that wraps a mock unstable API. The goal is to provide a rock-solid, thread-safe, and "Unity-friendly" interface for feature teams to use.

Additional information

- You will be provided with an unstable service mock written in C#.
- You must not modify the mock, but you should wrap the behaviour.

Objective: Build a wrapper for an events SDK that is notoriously unstable. It frequently hangs the main thread for 500ms and has a 20% failure rate. Feature teams are complaining that the game hitches whenever an event is sent.

Deliverables:

1. A ResilientAnalytics class that wraps the provided UnstableService.
2. Implementation of a Circuit Breaker to protect the game from constant failures.
3. A small Unity Editor Tool that shows the current status of the SDK (Closed, Open, Half-Open) and the total "saved" hitch time.

Guidelines

- If you use **AI tools** (e.g., ChatGPT, GitHub Copilot), include a brief note or README explaining which tools you used and how they helped.
- Spend **4–6 hours** on the task — we're looking for realistic, production-quality work, not extra polish.
- Focus on **core functionality**. If there's more you'd add with extra time, note it briefly in your README.
- If the core solution meets expectations, the **code review panel** will explore any unfinished areas or alternate approaches.

Good luck!

Fortis Games Values

We boldly go

We recognize that creative enterprises are inherently risky, and are not afraid to confront unknowns

- We evaluate problems thoroughly and objectively and recognize our biases
- We make decisions and move forward taking thoughtful risks in ambiguous spaces
- We accept the possibility of failure and use it as an important learning opportunity

We stay curious

We are students of our craft, our industry and ourselves

- We remain humble and recognize what we don't know
- We continuously improve, study the market and push ourselves to be leaders
- We challenge assumptions and probe for better solutions

We pursue excellence with candor

We are uncompromising about the standard and empathetic about how difficult it is to meet it

- We hold ourselves, and each other accountable for delivering our best work
- We provide honest feedback, directly and kindly
- We empower our people and teams with clear alignment, responsibilities, and decision making

We make each other better

We win as a team elevating, challenging, and supporting each other

- We invest in the growth of team members
- We create space and opportunities for those around us to succeed
- We welcome diverse points of view and seek to learn from one another
